Banking and Finance Domain Project

Step1:

Create an instance named Jenkins

• Install Java and Maven which we need in the Jenkins tools part

```
No VM guests are running outdated hypervisor (qemu) binaries on this host.
ubuntu@ip-172-31-35-56:~$ java -version
openjdk version "17.0.12" 2024-07-16
OpenJDK Runtime Environment (build 17.0.12+7-Ubuntu-1ubuntu224.04)
OpenJDK 64-Bit Server VM (build 17.0.12+7-Ubuntu-1ubuntu224.04, mixed mode, sharing)
ubuntu@ip-172-31-35-56:~$

i-019aa04bcd40d7c13 (Jenkins)
Public|Ps: 3.110.161.113 Private|Ps: 172.31.35.56
```

• Maven install

```
root@ip-172-31-35-56:/home/ubuntu# mvn --version

Apache Maven 3.9.9 (8e8579a9e76f7d015ee5ec7bfcdc97d260186937)

Maven home: /opt/maven

Java version: 17.0.12, vendor: Ubuntu, runtime: /usr/lib/jvm/java-17-openjdk-amd64

Default locale: en, platform encoding: UTF-8

OS name: "linux", version: "6.8.0-1016-aws", arch: "amd64", family: "unix"

root@ip-172-31-35-56:/home/ubuntu#

i-019aa04bcd40d7c13 (Jenkins)

PublicIPs: 3.110.161.113 PrivateIPs: 172.31.35.56
```

• Checking the path

```
root@ip-172-31-35-56:~# nano ~/.bashrc
root@ip-172-31-35-56:~# vi .bashrc
root@ip-172-31-35-56:~# nano ~/.bashrc
root@ip-172-31-35-56:~# source ~/.bashrc
root@ip-172-31-35-56:~# echo $JAVA_HOME
/usr/lib/jvm/java-17-openjdk-amd64
root@ip-172-31-35-56:~# echo $MAVEN_HOME
/opt/maven
root@ip-172-31-35-56:~#

i-019aa04bcd40d7c13 (Jenkins)
PublicIPs: 3.110.161.113 PrivateIPs: 172.31.35.56
```

To see if maven is working

```
root@ip-172-31-35-56:~# mvn
[INFO] Scanning for projects...
[INFO]
[INFO]
[INFO] Total time: 0.083 s
[INFO] Finished at: 2024-10-28T06:33:54Z
[INFO]
[ERROR] No goals have been specified for this build. You must specify a valid lifecycle phase or a goa plugin-group-id>:<plugin-artifact-id>[:<plugin-version>]:<goal>. Available lifecycle phases are: pre-c
ze, generate-sources, process-sources, generate-resources, process-resources, compile, process-classes
es, generate-test-resources, process-test-resources, test-compile, process-test-classes, test, prepare
egration-test, post-integration-test, verify, install, deploy, pre-site, site, post-site, site-deploy
         To see the full stack trace of the errors, re-run Maven with the -e switch.
         Re-run Maven using the -X switch to enable full debug logging.
         For more information about the errors and possible solutions, please read the following articl [Help 1] http://cwiki.apache.org/confluence/display/MAVEN/NoGoalSpecifiedException
   ot@ip-172-31-35-56:~#
  i-019aa04bcd40d7c13 (Jenkins)
  PublicIPs: 3.110.161.113 PrivateIPs: 172.31.35.56
```

Step 2

Installing jenkins

```
sudo wget -0 /usr/share/keyrings/jenkins-keyring.asc \
  https://pkg.jenkins.io/debian-stable/jenkins.io-2023.key
echo "deb [signed-by=/usr/share/keyrings/jenkins-keyring.asc]" \
  https://pkg.jenkins.io/debian-stable binary/ | sudo tee \
  /etc/apt/sources.list.d/jenkins.list > /dev/null
sudo apt-get update
sudo apt-get install jenkins
sudo systemctl enable jenkins
sudo systemctl start jenkins
sudo systemctl status jenkins
```

• Verifying the Jenkins installed

```
No VM guests are running outdated hypervisor (qemu) binaries on this host.

85eb092f36214b09a86b61c2399a956d

root@ip-172-31-26-213:/home/ubuntu# java --version

openjdk 17.0.12 2024-07-16

OpenJDK Runtime Environment (build 17.0.12+7-Ubuntu-1ubuntu224.04)

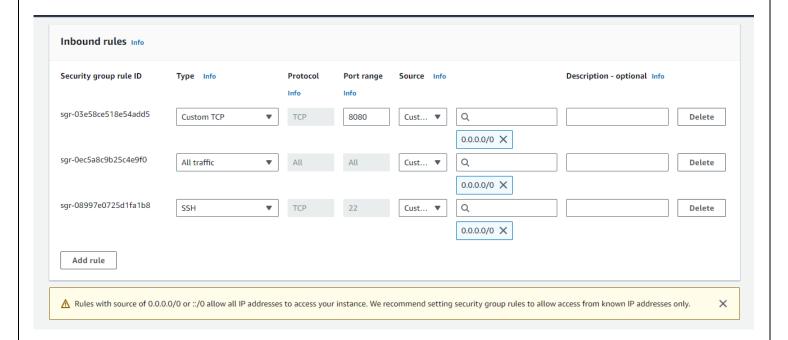

OpenJDK 64-Bit Server VM (build 17.0.12+7-Ubuntu-1ubuntu224.04, mixed mode, sharing)

root@ip-172-31-26-213:/home/ubuntu# jenkins --version

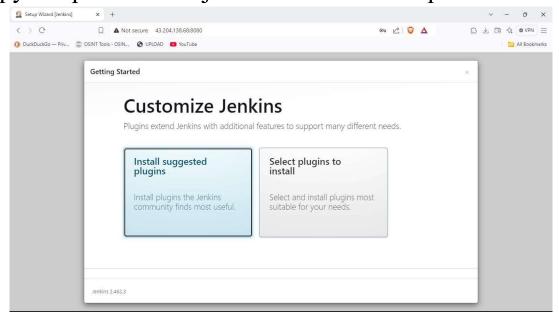

2.462.3

root@ip-172-31-26-213:/home/ubuntu#
```

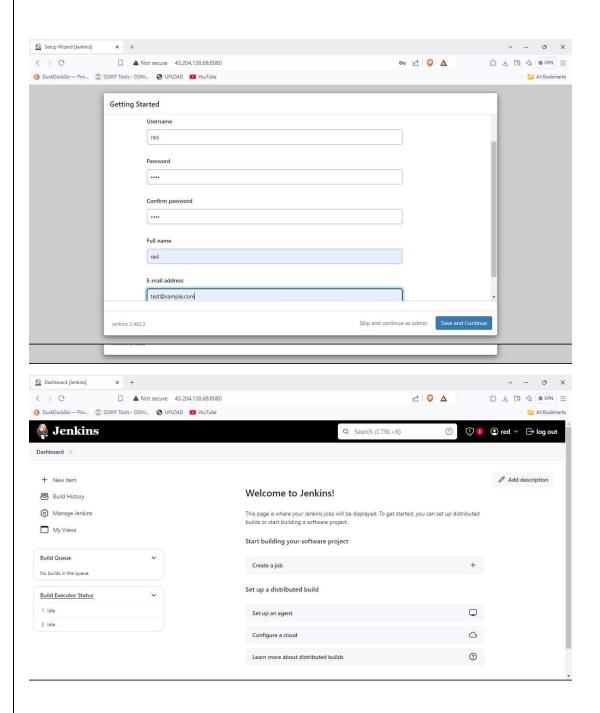

• Allow 8080 port in the security groups

• Copy the public IP of jenkin machine with port 8080

• Give the username and password to use jenkins

Step 4:

 Before starting using jenkins pipeline we need to allow the Jenkins user to execute any command without being prompted for a password

root@ip-172-31-26-213:/home/ubuntu# visudo

Restart the jenkins and login again

service jenkins restart

Step 5:

We need to install docker in the same machine and then we will give jenkins the permission to access docker

sudo apt install docker.io -y sudo usermod -aG docker jenkins service docker restart

```
root@ip-172-31-35-56:~# systemctl restart docker
root@ip-172-31-35-56:~# systemctl status docker

docker.service - Docker Application Container Engine
Loaded: loaded (/usr/lib/systemd/system/docker.service; enabled; preset: enabled)
Active: active (running) since Mon 2024-10-28 06:49:40 UTC; 3s ago

TriggeredBy: docker.socket
Docs: https://docs.docker.com
Main PID: 6678 (dockerd)
Tasks: 9
Memory: 24.0M (peak: 24.3M)
CPU: 236ms
CGroup: /system.slice/docker.service
L6678 /usr/bin/dockerd -H fd:// --containerd=/run/containerd/containerd.sock

i-019aa04bcd40d7c13 (Jenkins)
PublicIPs: 3.110.161.113 PrivateIPs: 172.31.35.56
```

Step 6:

Install Ansible:

```
root@ip-172-31-35-56:~‡ ansible --version
ansible [core 2.16.3]
config file = /root/ansible.cfg
configured module search path = ['/root/.ansible/plugins/modules', '/usr/share/ansible/plugins/modules']
ansible python module location = /usr/lib/python3/dist-packages/ansible
ansible collection location = /root/.ansible/collections:/usr/share/ansible/collections
executable location = /usr/bin/ansible
python version = 3.1.23 (main, Sep 11 2024, 14:17:37) [GCC 13.2.0] (/usr/bin/python3)
jinja version = 3.1.2
libyaml = True
root@ip-172-31-35-56:~‡
```

Step 7: Installing dependency plugins required for the project

Preparation · Checking internet connectivity Checking update center connectivity Javadoc Success JSch dependency Success Maven Integration Success Pipeline Maven Plugin API Success Config File Provider Success Pipeline Maven Integration Success Maven Invoker Success Generic Webhook Trigger Success GitHub Integration Success Ansible Success Cloud Statistics Success Authentication Tokens API Success Docker Commons Success Apache HttpComponents Client 5.x API Success Success Docker API Docker Success Docker Pipeline Success Loading plugin extensions Success HTML Publisher Success Loading plugin extensions Success

Step 8:

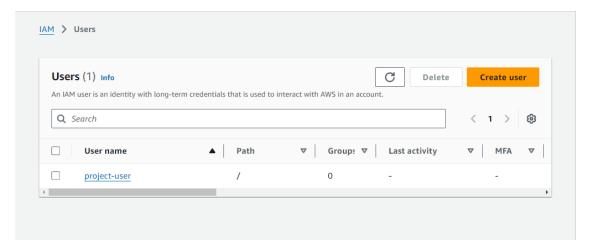

Install Terraform

```
root@ip-172-31-35-56:~# terraform -version
Terraform v1.9.8
on linux_amd64
root@ip-172-31-35-56:~#

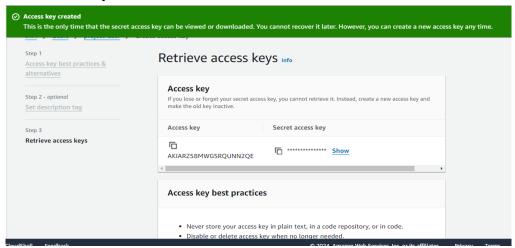

i-019aa04bcd40d7c13 (Jenkins)
PublicIPs: 3.110.161.113 PrivateIPs: 172.31.35.56
```

• Once the image is pushed we need to deploy our application .we deploy in the new instances so we use Terraform to create these new instances.

- To use terraform we need to configure AWS CLI which need secret keys
- Create a user and give admin policies

Create access keys

Step 9:

Go to tools and give the paths for the java, maven, ansible, terraform which we installed In the jenkins names instance.

Step 10:

Go to credentials and give necessary credentials which we require to run our pipeline according to Jenkinsfile

Docker credentials required to build image and push to hub

 To create instances using Terraform config file and ansible playbook

 Give the Aws secret keys so that Terraform can use AWS to create the infrastructure by which we can use it to deploy our applications

AKIARZ5BMWGSRQUNN2QE (AWS-ID)

AWS-ID

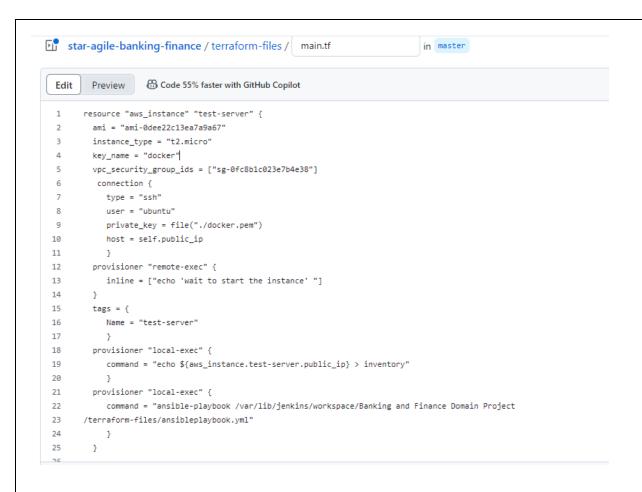

Usage

This credential has been recorded as used in the following places:

Note: usage tracking requires the cooperation of plugins and consequently may not track every use.

Step 11:

Create the terraform main.tf file to create an instance to deploy our application which will be created.

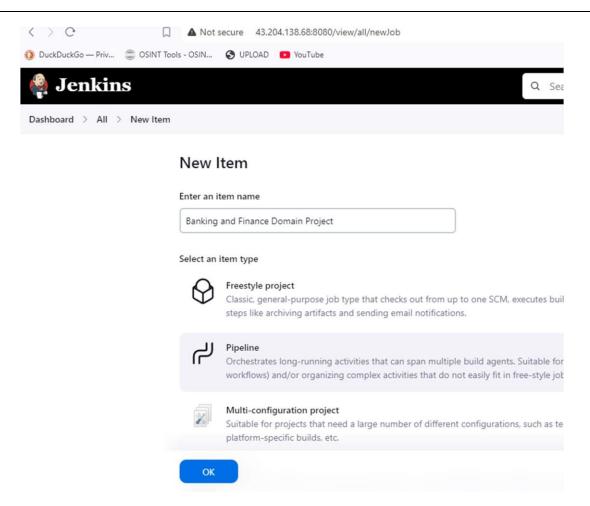

• Ansible playbook.yml file to install necessary package tools

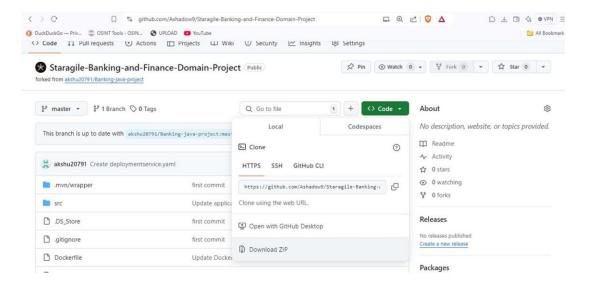

```
- name: Configure Docker on EC2 Instances
 hosts: all
 become: true
 connection: ssh
 tasks:
   - name: Updating apt
     command: sudo apt update
   - name: Install required packages
     command: sudo apt install -y apt-transport-https ca-certificates curl software-properties-common
    - name: Update apt again
     command: sudo apt update
    - name: Install Docker
     command: sudo apt install docker.io -y
    - name: Start Docker Service
     command: sudo systemctl start docker
    - name: Deploy Docker Container
     command: docker run -itd -p 8084:8081 skywalkerdarth/banking-project-demo:3.0
```

Step 12:

 Now,Select a new item from the Jenkins dashboard to create the job and slect the pipeline

Copy the GitHub repo in which we have the Jenkin file

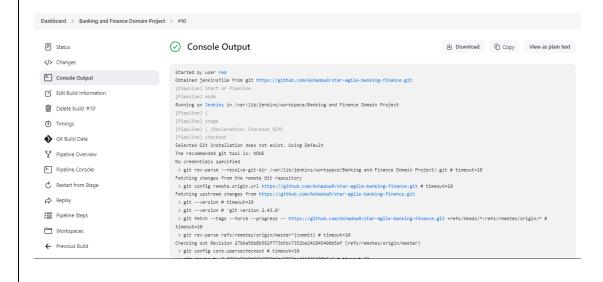

• paste it in scm in the pipeline configure option

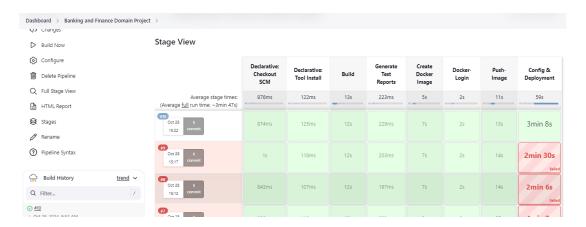

• Now, start the build and we can see the process:

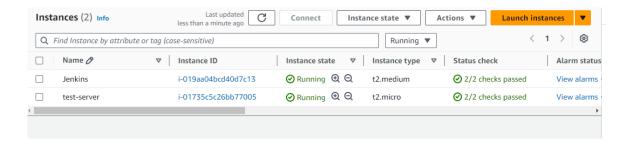

• The build is success:

Step 13:

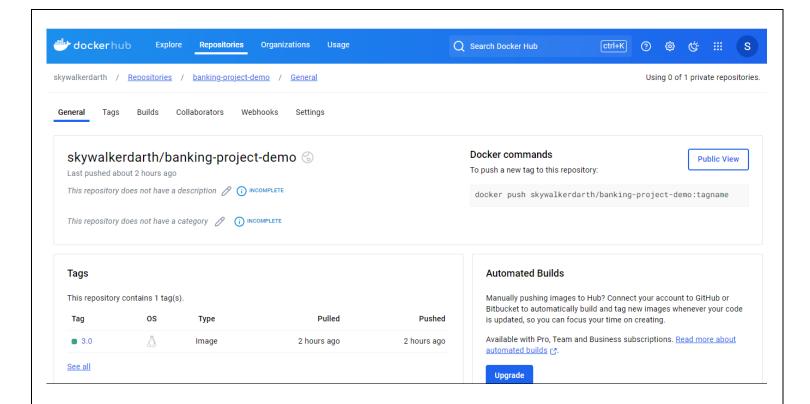

• The instance is created

• We can see the docker images and docker conatiners build from the pipeline

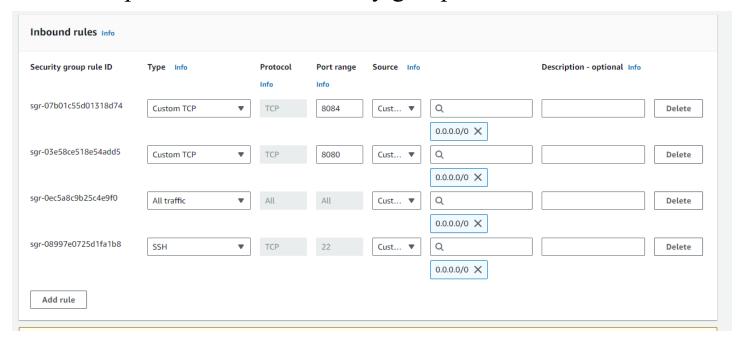

```
oot@ip-172-31-26-213:/home/ubuntu# docker ps
CONTAINER ID IMAGE
                                             CREATED
                                                            STATUS
                       COMMAND
                       "java -jar /app.jar" 8 minutes ago Up 8 minutes 0.0.0.0:8091->8091/tcp, :::8091->8091/tcp c000
a95601fba189 myimg
 oot@ip-172-31-26-213:/home/ubuntu# docker images
REPOSITORY TAG
                     IMAGE ID
                                   CREATED
                                                   SIZE
                     8cb3f8b3a13c 8 minutes ago
           latest
           11
                     47a932d998b7 2 years ago
root@ip-172-31-26-213:/home/ubuntu#
```

• The image is ushed into the docker hub

Step 14:

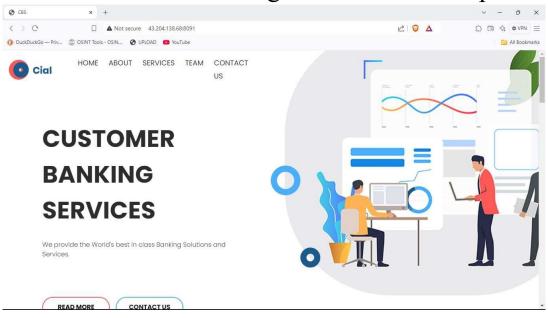

Allow the port 8084 in the security group of the Instance

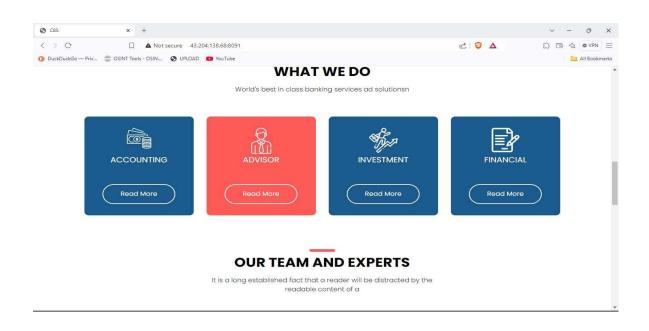

Step 15:

Now run the public IP address of the server with the port mentioned in the Jenkins file .

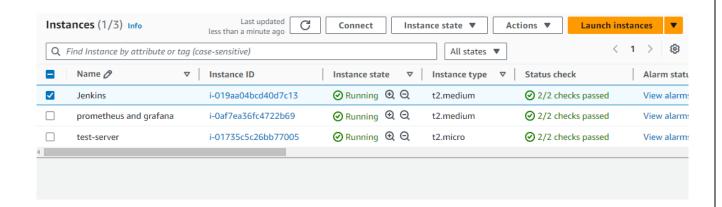

We can see the website is working on the mentioned port

Step 16:

• Create an instance and install Prometheus and Grafana in that.

• Installation steps:

 $Wget\ https://github.com/prometheus/prometheus/releases/download/v2.43.0/prom\ etheus-2.43.0.linux-amd 64.tar.gz$

 $tar\ -xvf\ prometheus\ -2.43.0.linux\ -amd\ 64.tar.gz$

sudo mv prometheus-2.43.0.linux-amd64/usr/local/Prometheus

cd /usr/local/Prometheus

• vi prometheus.yml

- job_name: 'node_exporter'

static_configs:

- targets: [publicip:9100']

```
- static_configs:
    - targets:
    # - alertmanager:9093

# Load rules once and periodically evaluate them according to the global 'evaluation_interval'.
rule files:
    # - "first_rules.yml"
    # - "second_rules.yml"

# A scrape configuration containing exactly one endpoint to scrape:
# Here it's Prometheus itself.
scrape_configs:
    # The job name is added as a label `job=<job_name>` to any timeseries scraped from this config.
- job_name: "prometheus"

# metrics path defaults to '/metrics'
    # scheme defaults to 'http'.

static_configs:
    - targets: ["localhost:9090"]
- job_name: 'node_exporter'
static_configs:
    - targets: ['35.154.59.115:9100']
"prometheus.yml" [readonly] 33L, 1029B
```

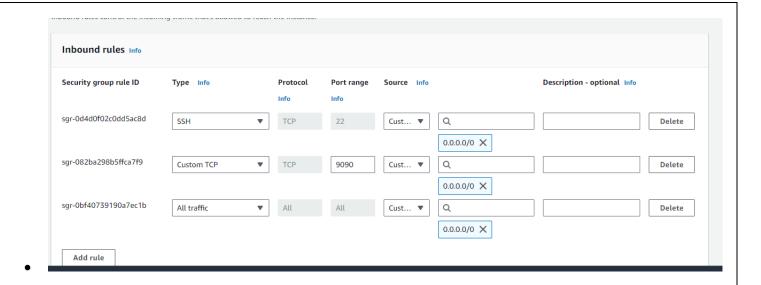

• Start Prometheus by running:

./prometheus --config.file=prometheus.yml

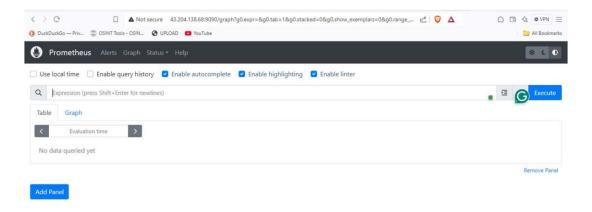

```
root@ip-172-31-26-213:/usr/local/prometheus vi prometheus.yml
root@ip-172-31-26-213:/usr/local/prometheus /prometheus -config.file=prometheus.yml

```

Prometheus will now be accessible via public ip :9090.

 Allow port 9090 in the security group of the Prometheus server

• Paste the public ip with port 9090 to access prometheus

• Node Exporter is down so we need to install node exporter

• Install Node Exporter (For Server Metrics)

 $wgeth\ ps://github.com/prometheus/node_exporter/releases/download/v1.6.0/node_exporter-1.6.0.linux-amd64.tar.gz$

```

• Grafana will be accessible via publicip: 3000.

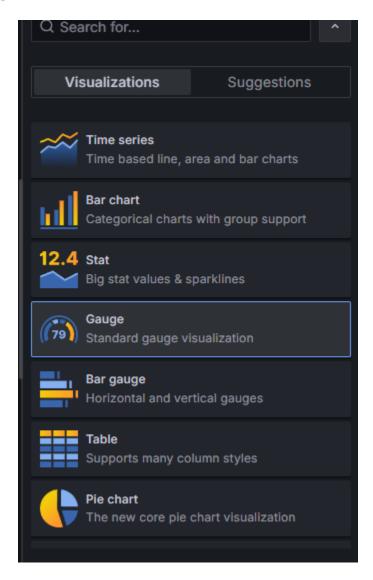

Dashboard of Grafana:

- navigate to Configuration > Data Sources.
- Click on Add Data Source, select Prometheus.
- Enter the URL of Prometheus: http://<your-server-ip>:9090.
- Click Save & Test to verify the connection.

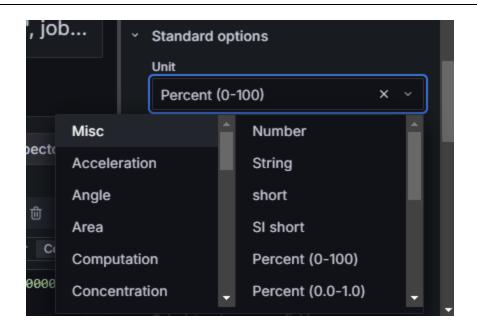

Step 18: Metric Visualization:

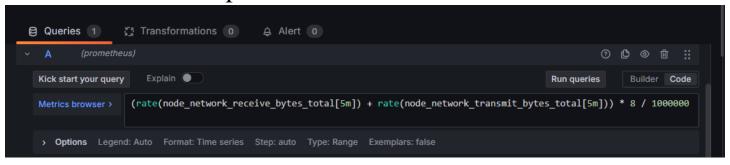

• Select gauge visualization to see the metric

• Select the Misc and percent (0-100) from standard options in unit

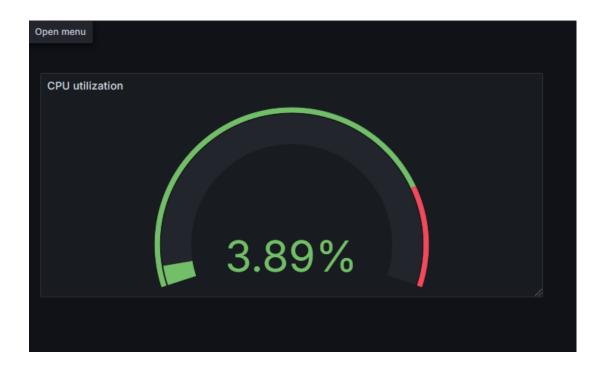

• Select the metric browser option and run queries and we can see the output visualization

Step 19:

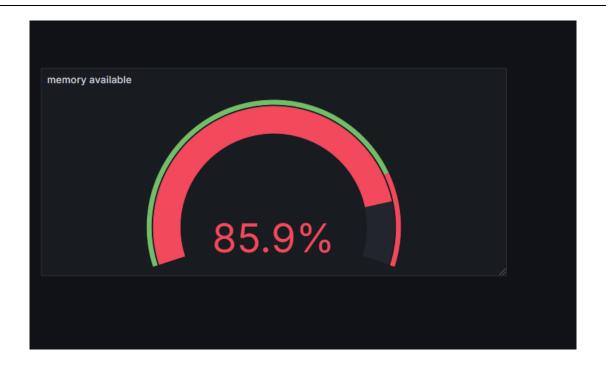

.1. **CPU utilization**: To see CPU utilization of the server use gauge and select misc and run queries and paste this

 $100* \ (1-avg \ by(instance) \ (rate(node_cpu_seconds_total\{mode-"idle"\}[5m])))$

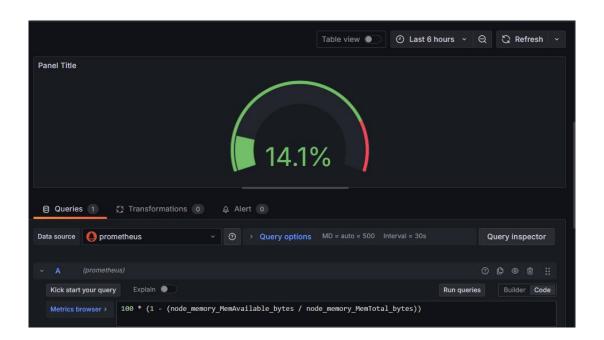

2. Total Available Memory:- To see available memory of the server

100 * (node_memory_MemAvailable_bytes / node_memory_MemTotal_bytes)

• To see the total memory

100 * (1 - (node memory MemAvailable bytes / node memory MemTotal bytes))

3. Disk Space Utilization

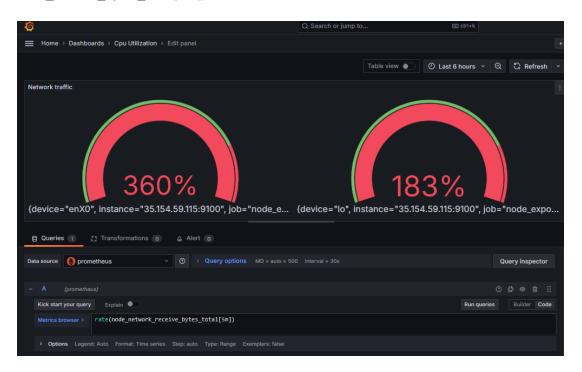

node_filesystem_size_bytes (Total Disk Size)

4. Network traffic

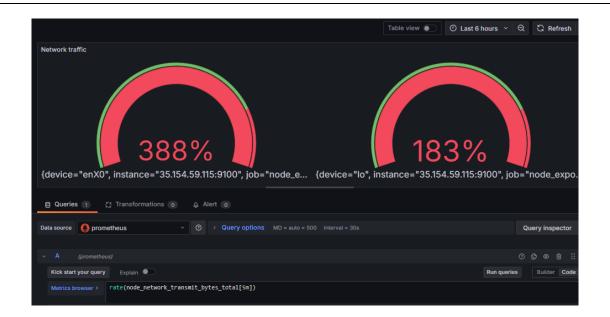

Incoming traffic:

rate(node_network_receive_bytes_total[5m])

Outgoing traffic

rate(node_network_transmit_bytes_total[5m])

Step 20:Make sure to terminate all the instances
